In this seminar, key topics of high relevance for the spatial development of contemporary urban landscapes are taught. These are approached in a transdisciplinary manner and embedded in a holistic view. Based on the principles of decarbonisation, adaptation to climate change, the fostering of biodiversity and an inclusive and equitable distribution of space, spatial design is understood as a key to the spatial discourse.

During the semester, students engage intensively with a selected topic and develop their own design approach based on theoretical texts and case studies from practice.
